Mahagoni

Swietenia mahagoni (L.) Jacq.

F- Meliaceae

Swietenia mahagoni is a medium-sized semi- evergreen tree. Bark is greyish in younger when matured its turns dark brown with furrowed. The leaves are bipinnate with 4-8 leaflets. The flowers are small produced in panicles. Fruits are woody capsule and oval in shape appear in tip of the branches. when matured, it automatically divided into five parts filled with numerous winged seeds. Mahogany is mostly grown for its better quality of timber wood. Wood is very costly in national and international markets. The recorded history of Swietenia mahagoni wood use in construction was in 1514 in Santo Domingo, now the capital of Dominican Republic. It is one of the very important species for construction and furniture purposes. It is easily propagated through seeds.
