Dragon bamboo

***Dendrocalamus asper* (schult.) Backer**

F- Poaceae

Dendrocalamus asper is also known as gaint bamboo or Dragon bamboo.It grows up to 15-20m tall and 8-12 cm in diameter. Its commonly found in India, Sri lanka, China e.t.c. This is traditionally used as a building material for heavy construction. Young shoots are also edible as a vegetable. Thisone of the most popular bamboo species in Asia whose shoots are used as a source of food. Its culms are grayish green and becomes dull brown on drying.Lower nodes are covered with brown hair.It occurs in our institute and multiplied through tissue culture.
