Sandal Wood Tree

Santalum album L.

F- Santalaceae

Santalum album is a medium size evergreen semi-parasite tree that depends on roots of other suitable host plants species like *Cajanus cajan*, *Mimosa pudica*, *Casuarina*, *Acacia*, etc. because these plants produce fixed nitrogen to the soil, a type of natural fertilizer. The bark is grey with vertical fissured and the leaves are opposite elliptic lance-shaped. The flower is white colour and small and produced in clusters. Berry like black fruits contain single seeds. Sandal is growing for its valuable fragrant wood and oil extracted from heartwood through a steam distillation process. In India there are two varities namely *Santalum album* and another one is *Pterocarpus santalinus* . It is mostly cultivated or harvested from natural forest for extraction of timber and essential oil. It's also uses for medicinal purpose including antifungal and antimicrobial. The main ingredient is sandalwood oil is a santalol that has many therapeutic properties. Oil is also used in cosmetics items. Cost of essential oil is approximately 75000- 125000/ Kg. In India, Karnataka, Maharashtra, Andhra Pradesh, Kerala and Tamil Nadu are mainly producer.
