Curry Leaf Tree

Murraya koenigii L.

F- Rutaceae

It is a small size deciduous tree, the bark is light black and fissured, leaves are feather compound with pointed thin leaflets. The plant produces small white flowers on the end of the twigs in clusters, small shiny black drupes containing single seeds. Fruits are edible with a sweet flavour. It is often cultivated for its leaves because leaves are most widely used in South Indian cooking recipes like Rasam, Sambhar, Idali, Dosa, Vada, and Kadhi. The plant is sometimes called sweet neem.
