Dalbergia lanceolaria (Roxb.)

F- fabaceae

Dalbergia lanceolaria is a medium size deciduous tree, native to India, Sri Lanka and Nepal. The bark is dark brown with black patches, the leaves are compound, and leaflets are ovate or obovate. Pink flowers are developed in axillary or terminal panicles. Fruits are flat and narrowed at both ends having single seeded. This is one of the handsome trees for plantation due to producing new stems. It is recommended for reforestation. The bark of the tree is used as an analgesic and anti- diarrhoea. Easily propagated through seeds.
