Fountain tree

Spathodea campanulata P. Beauv.

F- Bignoniaceae

Spathodea campanulata is a large size flowering tree, deciduous in nature. Its bark is light brown in colour. Sometimes black patches are on it. It is commonly known as the fountain tree or African tulip. The leaves are pinnate with glossy deep green. The flowers are orange-scarlet in a cup shape that holds rain and dew. It attracts birds and its wood is used for making boxes, match sticks, and toothpicks. It is widely planted for ornamental purposes. The flower bud is ampule-shaped and contains water. The children sometimes play with these buds because of their ability to squirt water; so, children use them as water pistols.
