Silk Tree	<i>Albizia chinensis</i> (Osbeck) Merr.	F-Fabaceae
Albizia chinensis or Silk Tree is a large deciduous tree with broad flat-topped crown and smooth grey bark. Leaves are double compound, like those of Gulmohar, but the final leaflets are very numerous, 10 mm long. Flowers are yellowish white, in clusters occurring either in the leaf axils or at the end of branches. Long white numerous stamens make it look like a powder-puff flower. Flower looks thinner than those of Siris tree. Important browse tree in hilly areas; also grown for shade on plantations and for the manurial value of the fallen leaves. The branches are used for fodder at the end of the growing season when the leaves are past their succulent stage.
